Novel nucleic acids, used to develop products for the diagnosis and treatment of disorders involving unwanted cell proliferation, particularly cancers, especially colon cancer

Claim 15; Page 258; 469pp; English.

Any solution to 280766 represent double stranded cDNA clones isolated from the human colorectal adenocarcinoma (colon cancer) cell line SW480. The colon clones can be used to generate antisense oligonucleocides which can be used for antisense therapy. Methods and products from the present invention can be used for identifying and/or classifying cancerous cells present in a human tumour, particularly in solid tumours, e.g. carcinomas and sarcomas, e.g. breast or colon cancers. The cDNA clones can be used for developing agents for the diagnosis and treatment of disorders. Involving unwanted cell proliferation, such as neoplasia, dysplasia or hyperplasia

double-stranded DNA, which comprises one of the 7837 "GS" sequences glouble-stranded DNA, which comprises one of the 7837 "GS" sequences given in T19001-T2687 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(7) as the sole primer. Since the 3'-confincted cDNAs hybridise with specific mRNAs beaches almost all the 3'-criented cDNAs hybridise with specific mRNAs. Each library is confirtucted so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS. sequences) as a means of diagnosing abnormal cell function or for

X10269-X12937 are human DNA fragments which contain biallelic polymorphic markers which have been isolated using the primers represented in X09121-X10268. The base occupying the polymorphic site is indicated by the appropriate IUPAC-IUB ambiguity code. These fragments can be used in methods for determining polymorphic forms in an individual for use in e.g. forensics, paternity testing or for phenotypic typing for diseases such as agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Aidrich syndrome, Fabry's disease, familial hypercholesterolemia, polycystic Kidney disease, hereditary spherocytosis, von Willebrand's disease, hereditary shaemorrhagic telangiectasia, familial colonic polyposis, Ehlers-Danlos syndrome, osteogenesis imperfecta, acute intermittent porphyria, autoimmune diseases, inflammation, cancer, diseases of the nervous system, infection by pathogenic microorganisms, and characteristics such endurance, fertility and susceptibility or receptivity to particular drugs or therapeutic treatments. The isolated polymorphic nucleic acid proporty such diseases. such diseases

The polyuncleotides of the invention are all secreted EST sequences isolated from a variety of human tissue sources. The EST sequences and proteins encoded by them are predicted to thave useful biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, immune stimulating or suppressing activity, haematopolesis regulating activity, tissue growth activity, haemostatic activity, haemostatic

This polynucleotide comprises the lactoferrin receptor (lfr) locus of Moraxella catarrhalis (Branhamella catarrhalis) Q8. There are 3 tandem genes in locus, identified as lbpA, lbbB (alternative protein 2 (lbp2, see WB941), lactoferrin binding protein 1 (lbp1, protein 2 (lbp2, see WB941), lactoferrin binding protein 3 (DRF3, see WB9420). The lfr locus was identified following generation of a M. catarrhalis strain Q8 genomic DNA library and screening with specific hybridisation probes. The genes and DNA sequences of the granton of diagnostis, immunisation, and the compositions, including vaccines, based upon expressed recombinant compositions, including vaccines, based upon expressed recombinant club, and/or Lbp2 and/or ORF3, portions of these or their analogues, can be prepared for prevention of diseases caused by Moraxella. M. catarrhalis is a causative agent of otitis media and has been associated with sinusitis, conjunctivitis and inflammatory diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; PRO; EST; expressed sequence tag; PCR primer; hybridisation; probe; blood coagulation disorder; center; cellular adhesion disorder; secreted protein; transmembrane protein; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
Lactoferrin receptor genes from Moraxella, especially M. catarrhalis - useful to diagnose Moraxella infection e.g. to detect otitis media due to M. catarrhalis infection and to immunise against such
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

                                                                                                                                                                                                                                                                                          The present invention describes secreted and transmembrane polypeptides and their polynucleotides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic animals. The proteins can be used to treat a variety of diseases and disorders, depending on their function. Diseases that may be treated include blood coagulation disorders, cancers and cellular adhesion disorders. They may also be used to raise antibodies. 233891 to 234338, and Y41885 to Y41774 represent polynucleotide and polypeptide sequence given in the exemplification of the present invention.

vaccines to treat or prevent H. pylori
                                                                                                                                                                                                                                                                                                                                                                                                                                                      The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors. The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacteratal DNA. The sequences were analysed for one of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF membrane proteins. Having identified and determined the sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Note: This DNA sequence is not reproduced in the specification and has been derived from the related specification, WO9719098.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Chronic gastritis; duodenal ulcer disease; activator; inhibitor; bacterial life cycle; vaccine; immunisation; detection; antisense; inhibition; cytoplasmic; Na+/H+ antiporter; Escherichia coli; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    T77453;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           RESULT
T77453/c
This sequence encodes a peptide that specifically binds to the human sucrose-isomaltase complex. The invention relates to purified proteins (I) that bind specifically to at least one of the gastro-intestinal (GI) tract receptors human intestinal decisions associated transporter (HPII), hPEPTI, DZH and human peptide-associated transporter (HPII), hPEPTI, DZH and human sucrose-isomaltase complex (HSI). (I) provide active transport of therapeutic agents through human and animal GI tissue (into the blood) for in vivo delivery, particularly for treatment or prevention of hypertension, diabetes, osteoporosis, haemophilia, anaemia, cancer, migrathe, or angina pectoris. Specifically they are used to deliver insulin or leuprolide, but many other suitable therapeutic agents are disclosed, including genes or inhibitory nucleic acid, imaging agents and antigens. (I) may also provide targeting to the GI tract. Other uses of (I) ane (I) are (I) to determine the level of specified receptors in a sample (in a binding assay); and (ii) to screen for molecules that bind (I). Immunogenic analogues or derivatives of (I) are used to raise antibodies and in immunosasys. The antibodies are used to locate, detect and massing the provided target are used to locate, detect and massing of the information of the content of an immunosasys.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

279917 to 280766 represent double stranded cDNA clones isolated from the human colorectal adenocarcinoma (colon cancer) cell line SW480. The cDNA clones can be used to generate antisense oligonucleotides which can be used for antisense therapy. Methods and products from the present invention can be used for identifying and/or classifying cancerous cells present in a human tumour, particularly in solid tumours, e.g. carcinomas and sarcomas, e.g. breast or colon cancers. The cDNA clones can be used for developing agents for the diagnosis and treatment of disorders involving unwanted cell proliferation, such as neoplasia, dysplasia or

These linkers are complementary to the BstXI-cut pMPX vectors, while the overhang is not self-complementary. Therefore the linkers will not concatemerise nor will the cut vector re-ligate itself easily. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 linker-adapter inserts were ligated to each of the 20 pMpX vectors to construct a series of shotgun subclone libraries. The purified DNA samples were then sequenced.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human, gene expression product; diagnosis; tumour; colon cancer; colorectal adenocarcinoma; cell line SW480; cell proliferation; cytostatic; sarcoma; breast cancer; neoplasia; dysplasia;
                                                                                                                                                                                                                                                                                                                                                                                                                                    Helicobacter pylori nucleic acid sequences and related proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence encodes a Helicobacter pylori cytoplasmic protein, which was found to be homologous to Escherichia coli Na+/H+ antiporter protein following BLAST protein analysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The ORF/protein reference number for this sequence was

```
protein of the invention. TIK is a phytic acid (Mychinosittal 1/2,3,4,5,6-hexaphosphate) blosynthetic enzyme. The ITK enzymes of the invention may be prepared recombinantly and used to raise antibodies, which are used for detecting the enzymes in situ in cells or in vitro in cell extracts. The polynucleotides of the invention may be used to reacte transgenic plants in which the ITK levels are present at higher or lower levels than normal, or in cell types or developmental processes where they are not normally found. This would alter the level of 1,3,4-triphosphate 5/6 kinase found in those cells. In addition, it may be desirable to eliminate expression of ITK genes for certain applications. The polynucleotides also serve as a source of probes and applications. The polynucleotides also serve as a source of probes and applications. Which are useful for genetic mapping, as markers for traits linked to those genes, and increased amounts of available phosphate in animal feeds such as corn would lead to improved feed efficiency. The proteins of the present invention lead to a better understanding of the phytic acid blosynthesis pathway, allowing it to be exploited for commercial uses, e.g. in animal
                                                   Novel phytic acid biosynthetic enzymes used to alter the level of the

The present sequence encodes a H. pylori cytoplasmic protein.

The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors.

The genomic sequence of H. pylori (ATCC 55679) was determined from coverlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORP of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts.
                                                                                 Helicobacter pylori nucleic acid sequences and related polypeptide(s) - useful for vaccines to treat or prevent H. pylori infection, and to detect Helicobacter

the invention (the encoded protein is not given in the specification). The inhibitor is a Kexz proteinase family enzyme inhibitor with a molecular weight of 11,500. The inhibitor/protein (termed Kexstatin) is expected to have pharmaceutical and pesticidal applications.
                                              sequence is the coding sequence for an example of the inhibitor of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                The new human secreted proteins are encoded by polynucleotides obtained from human placenta, adult testes, fetal kidney, fetal brain, adult brain and adult blood cDNA libraries. The polynucleotides and proteins are predicted to have biological activities which would make them suitable for treating, preventing or amellorating medical conditions in humans and animals.                                                                                                                                                                                                                                                                                                                          activities include nutritional activity, cytokine and cell proliferation/differentiation activity, immune stimulating (e.g. as vaccines) or suppressing activity, immune stimulating (e.g. as activity, tissue growth activity, activity/inhibin activity, chemotactic/chemokinetic activity, activity/inhibin activity, activity, acceptor/ligand activity, anti-inflammatory activity, cadherin/tumour invasion suppressor activity, and tumour inhibition activity. The polynucleotides are also stated to be useful for gene therapy. The sequences are identified by a secretory leader sequence motif in the polynucleotide and it is thought that the encoded proteins have biological activity by virtue of their secreted mature. This clone was designated AC222_1. A probe for this clone is described in X08698.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Kex2 protease inhibitor protein - with potential pharmaceutical and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequence is that of a cDNA sequence cc43, which was isolated from the 20q13 amplicon. It is expressed in normal tissues but not been found in the breast cancer cell line. It can be used as a probe for the detection of chromosomal abnormalities at 20q13. It and other sequences isolated from the 20q13 amplicon are consistently amplified in primary tumours. These sequences are useful as probes or as probe targets for monitoring the relative copy number of corresponding sequences from a biological sample such as tumour cells. The sequences can also be used in therapeutic applications for modulating the expression of the endogenous gene or the activity of the gene product. Examples of therapeutic approaches include antisense inhibition of gene expression, gene therapy, and monoclonal antisense inhibition of gene expression, gene products. The products can also be used in the treatment of other diseases, e.g. age-related macular degeneration, peber's congenital amaurosis and retnitis
                                                                                                                                                                  20q13 amplicon; chromosome 20; tumour; detection; chromosomal abnormalities; probe; gene therapy; antisense inhibition; treatment; age-related macular degeneration; retinitis pigmentation; Leber's congenital amaurosis; ds.

```
which contains a nucleic acid (1) that codes for a protein (II) of the DEAD-superfamily. (A), and recombinant insect viruses derived from them, are used to express recombinant (II), particularly RNA and DNA helicases. (II) are potentially useful for: (a) production of cell lines for research into cancer, inflammation and apoptosis, or for clarifying the mechanism of action of drugs, and (b) to identify pharmaceutical activity in known compounds, e.g. anticancer and antiviral activities. (II), which are difficult to express in bacteria and yeast, are expressed at high level in insect cells, e.g. 300-400 mg per 109 cells. This sequence encodes a human RNA-helicase pl35 protein which is used in the description of the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes the construction of a novel insect cell vector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New insect cell vector containing the sequence encoding a DEAD-superfamily protein, particularly a nucleic acid helicase, used e.g. for identifying potential pharmaceuticals

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes secreted and transmembrane polypeptides and their polynuclectides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic animals. The proteins can be used to treat a variety of diseases and

kallfxrein 2 (hKZ) DNN. The method comprises: (a) contacting DNA obtained by reverse transcription (RT) of RNA from a human physiological sample which comprises cells suspected of containing hKZ RNA with at least 2 oligonuclectides to amplify the DNA by PCR to yield amplified hKZ DNA, where the conditions amplify the DNA obtained by RT of RNA from at least one cells; and (b) detecting the presence of the amplified hKZ DNA. The method can be used for detecting, monitoring the prospession of and pathologically staging prostate cancer. The present sequence represents the coding strand of native genomic hKZ.

bones)) encoding proteins influencing bone development in mammals. The proteins of the invention reduce and/or inactivate bone extension (i.e. development), with exception of the skull and have osteopathic activity. The nucleic acid molecules, proteins and antibodies can be used in diagnostic or pharmaceutical compounds e.g. for gene therapy. The methods and nucleic acid molecules, etc. are useful for production of transgenic animals, especially a transgenic mouse for the study of diseases associated with bone development, e.g. spondyloepiphysal dysplasia and achodroplasia. This sequence encodes a human LOBO protein described
                                                                                                                                     novel nucleic acids (I; designated LOBO (long

```
codon of this exon.

Shar 7211 was introduced into embryonic mouse stem cells by electroporation. Wild type mice have in their serum no antibodies carrying the human kappa gene constant region, but in mice homozygotic for the mutation, such antibodies were present at
(3) inserting a 1.1 kb fragment contg. the neomycin resistance gene of pMCIneo; (4) inserting the 2.8 kb fragment of pHJkappa (contg. the J1-5) elements); then (5) finally inserting a 427 bp fragment made by port mouse germ line DNA using one primer (054683) which hybridises 12 bp after the start of the C kappa exon and another (054684) which hybridises 137 bp after the stop

The sequences comprise a central core repeat sequence, especially selected from the sequences A32094-A32096 with left and right flanking sequences. The polynuclectide sequences can be used in the detection of DNA polymorphisms, in genome mapping, in physical mapping, in positional cloning of genes, in variety identification and in evaluation of genetic variability within and between plant tissues, populations, cultivars, species and species groups. They may also be used to design hybridization probes for oligonuclectide fingerprinting and library screening and to design
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         useful to locate specific economically useful genes in plant genomes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           for microsatellite-primed PCR. Microsatellite markers are

and associated flanking species. The sequences comprise a central core repeat sequence, especially selected from the sequences A32094-A32096 with left and right flanking sequences. The polynucleotide sequences can be used in the detection of DNA polymorphisms, in genome mapping, in physical mapping, in positional cloning of genes, in variety identification and in evaluations of genetic variability within and between plant tissues, populations, cultivars, species and species groups. They may also be used to design hybridization probes for oligonucleotide fingerprinting and library screening and to design primers for microsatellite-primed PCR. Microsatellite markers are useful to locate specific economically useful genes in plant genomes.

Sequences. A31040-A32093 represent novel plant microsatellite sequences

```
A00010 to A02716 represent polynucleotides isolated from cDNA libraries constructed from human colon cancer cell lines. The present invention also describes a method of detecting differentially expressed genes correlated with a cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample derived from a cell suspected of being cancerous, where detection of the differentially expressed gene product is correlated with a cancerous state of the cell from which the test sample was derived.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The polynucleotides sequences can be used in a method for detecting differentially expressed genes correlated with a cancerous state of a mammalian cell. The polynucleotides can also be used as probes for detecting and mapping related genes. They can be used in diagnosis and prognosis of diseases and disorders (e.g. identification of pre-metastatic cancerous states, stages of cancer, or responsiveness of cancer to therapy). This is particularly for breast cancer, oestrogen receptor-positive breast cancer, oestrogen receptor-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Polynucleotide library used to determine cancerous states of mammalian

                                                                                                                                                                                                                                                                                                                                                                                                                                                                        polypeptide associated with non-A, non-B, non-C, non-D, non-E hepatitis virus (n-(ABCDE) virus) infection, and is obtained by preparing a phage from a phage lambda gill library of MY 190 DNA (ATCC 75284) n-(ABCDE) hepatitis serum, plating to form plaques, and screening the phage plaques for the production of polypeptides immunoreactive with n-(ABCDE) serum. n-(ABCDE) hepatitis virus polypeptides can be used for the production or detection of antibodies, and in vaccines. The antibodies can be used for detection, diagnosis and in passive immunotherapy. The DNA can also be used in detection and diagnosis, and as hybridisation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  probes for identification of further n-(ABCDE) hepatitis coding sequences. Culture systems producing the n-(ABCDE) polypeptides can be used in screening studies.

```
squences, corresponding to human secreted proteins. Y64651 to Y65438

represent the EST-related proteins corresponding to 24226 to 243052.
The S ESTs can be used for producing secreted human gene products.
They can be used to identify and isolate 5' untranslated regions (UTRS) and upstream regulatory regions which control the location, development stage, rate, and quantity of protein synthesis, as well as stability of mRNA. The ESTs are also useful as probes for chromosome mapping, and to obtain full length cDNA clones. The ESTs can also be used in forensic procedures to identify individuals having genetic diseases resulting from abnormal gene expression. The products may also be used in gene therapy protocols. The nucleic acids encoding signal peptides can be used for directing extracellular secretion of a polypeptide or the insertion of a polypeptide into a cell. The proteins encoded by the EST sequences may be useful in treating a variety of human conditions. Secreted proteins have therapeutic value, and the identification of mew secreted proteins is valuable. Z42249 to a valuation of the present sequences used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel secreted protein 5' expressed sequence tag sequences used in diagnostic, forensic, gene therapy, and chromosome mapping procedures
                                                     Human; 5' EST; expressed sequence tag; secreted protein; diagnosis; gene therapy; chromosome mapping; upstream regulatory sequence; forensic; location; development; protein synthesis; stability; regulation; identification; ss.
Human 5' EST isolated from a cDNA library SEQ ID NO:402.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              242265 to 243075 represent novel 5' expressed sequence

preventing generation of fertile sperm.

The present sequence encodes the short form (5) of murine Bim, or Bc1-2 interacting mediator of cell death (see W98154), a novel member of the Bc1-2 family that is capable of inducing cell death (apoptosis) and which acts as a 'death-ligand' for certain members of the pro-survival Bc1-2 family. Bim is a BH3-only protein, as the colly Be1-2 homology region which it encompasses is BH3. It is the colly BH3-only protein for which splice variants exist. These result in the expression of a variety of isoforms, i.e. Bim.5, Bim.1 and Bim.EL (see W98154-56). cDNAs encoding these murine Bim isoforms were obtained from a T lymphoma cDNA library using human recombinant Bc1-2 protein. The murine Bim gene has been mapped to chromosome 2 at bands F3-G. Human Bim.L and Bim.EL isoforms have chain was shown to regulate the pro-apoptotic activity of Bim. Bim.5, the splice variant which does not bind to dynein light chain, is a much more potent killer than either Bim.L or Bim.EL. The invention provides variants (see W98159-68) of murine and human Bim.L or Bim.E. that cannot bind, couple or otherwise associate with a dynein light chain. The identification of Bim permits the identification and rational design of a range of products for use in therapy, diagnosis, antibody generation and involving modulation of physiological cell death. These therapeutic molecules may act as either antendands and involving modulation as either antendands. useful in cancer, autoimmune or degenerative disease therapy.
Increased Bine expression or Bim activity is useful, e.g. for
treatment or prophylaxis in conditions such as cancer and deletion
of autoreactive lymphocytes in autoimmune disease. Decreased Bim
expression of Bim activity is useful in regulating inhibition or
prevention of cell death or degeneration such as under cytotoxic
conditions during e.g. gamma-irradiation and chemotherapy or during
HIV/AIDS or other viral infections, isohemia, myocardial infarction. hypoxia, degenerative diseases or for prolonging the survival of cells being transplanted for treatment of disease. Since Bim is expressed in germ cells, modulating Bim expression or Bim activity New isolated member of the Bcl-2 family, Bim used in, e.g. cancer is useful; e.g. as a contraceptive or method of sterilization by cell cycle; mouse; cancer; autoimmune disease; degenerative disease; therapy; contraceptive; splice variant; 3im-S; Bcl-2 interacting mediator of cell death; apoptosis; O'Connor L, O'Reilly L; (HALL-) HALL INST MEDICAL RES WALTER & ELIZA. ```
A single-stranded DNA (or its complementary strand or the corresp. double-stranded DNA) which comprises one of the 7837 "GS" sequences given in T19001-T26837 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of CDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-end of mRNA hybridise with specific mRNAs pacies, almost all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for

**X40826 to X41093 represent 5' expressed sequence tags (ESTS) for human secreted proteins, and encode the proteins given in Y01602 and Y11994 to Y12260, respectively. The proteins given represent the signal peptide and an N-terminal fragment of a secreted protein. The nucleic acid sequences can be used for producing secreted human gene products. They can also be used for products for diagnosis and therapy. The proteins obtained may have cytokine activity, cell proliferation/differentiation activity, haematopoissis regulating activity, tissue growth regulating activity, reproductive hormone regulating activity, chemotactic/chemokanchic activity, haemastepic activity, tumour inhibition activity or other activity, haemostatic and thrombolytic activity, receptor/ligand activity, anti-inflammatory activity, tumour inhibition activity or other activity anti-inflammatory. The sequences can also be used for obtaining corresponding promoter sequences. The nucleic acids encoding the signal peptide can be used for directing extracellular secretion of a polypeptide or the insertion of a polypeptide into a membrane, or importing a polypeptide into
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

New isolated member of the Bcl-2 family, Bim used in, e.g. cancer treatment

Claim 3; Page 94-95; 145pp; English.

The present sequence encodes the long form (L) of murine Bim, or member of the Bal-1 family that is capable of inducing cell death (see W98155), a novel member of the Bal-1 family that is capable of inducing cell death apoptosis) and which acts as a 'death-ligand' for certain members of the pro-survival Bal-2 family. Bim is a BH3-only protein, as the only BH3-only protein for which splice variants exist. These result in the expression of a variety of isoforms, i.e. Bim-S, and Bim-EL (see W98154-56). CDNAs encoding these murine Bim isoforms were obtained from a T lymphoma cDNA library using human recombinant Bal-2 protein. The murine Bim gene has been mapped to carombosome 2 at bands F3-G. Human Bim-L and Bim-EL isoforms have also been identified (see W98157-58). Binding the dynein light chain was shown to regulate the pro-apoptotic activity of Bim. Bim-S, the splice variant which does not bind to dynein light chain, is a much more potent killer than either Bim-L or Bim-EL that cannot bind, couple or otherwise associate with a dynein light chain. The identification of Bim permits the identification and rational design of a range of products for use in therapy, diagnosis, antibody generation and involving modulation of physiological cell death. These therapeutic molecules may act as either antagonists or agonists of Bim's function and will be useful in cancer, autoimmune or degenerative disease therapy. Increased Bim expression or Bim activity is useful, and repression or Bim activity is useful, and season of autoreactive lymphocytes in autoimmune disease. Decreased Bim carterion of autoreactive lymphocytes in autoimmune disease. Decreased Bim carterion of cell death or degeneration and chemotherapy or during conditions during e.g. gamma-irradiation and chemotherapy or during the degeneration and chemotherapy and degeneration and chemothera cells being transplanted for treatment of disease. Since Bim is, expressed in germ cells, modulating Bim expression or Bim activity is useful, e.g. as a contraceptive or method of sterilization by preventing generation of fertile sperm. degenerative diseases or for prolonging the survival of

Sequences A31040-A32093 represent novel plant microsatellite sequences and associated flanking species. The sequences comprise a central core repeat sequence, especially selected from the sequences A32094-A32095 with left and right flanking sequences. The polynuclectide sequences can be used in the detection of DNA polymorphisms, in genome mapping, in physical mapping, in positional cloning of genes, in variety identification and in evaluation of genetic variability within and between plant tissues, populations, cultivars, species and species groups. They may also be used to design hybridization probes for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ģ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Calcium ion channel alphal subunit exons 33, 34/intron; partial sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequences A31040-A32093 represent novel plant microsatellite sequences and associated flanking species. The sequences comprise a central core repeat sequence. especially selected from the sequences A32094-A32096 with left and right flanking sequences. The polynucleotide sequences can be used in the detection of DNA polymorphisms, in genome mapping, in physical mapping, in positional cloning of genes, in variety identification and in evaluation of genetic variability within and between plant tissues, populations, cultivars, species and species groups. They may also be used to design hybridization probes for oligonucleotide fingerprinting and library screening and to design
                                                                                                                                                  Plant microsatellite sequence; core repeat sequence; detection; probe; DNA polymorphism; genome mapping; physical mapping; fingerprinting; variety identification; genetic variability evaluation; primer; ss.

calcium ion channel alpha 1 subunit gene and part of untranslated calcium ion channel alpha 1 subunit gene and part of untranslated sequences. The channel is related to familial hemiplegic migratine (FHM) calcium ion channel is related to familial hemiplegic migratine (FHM) associated with a gene present in humans on chromosome 19p13.1-13.2. The encoding gene can be used to localise or identify genes related to or episodic neurological disorders, specifically migraine, FHM or EA-2, but also epilepsy. The isolated or a recombinant nucleic acid can also be used to distinguish between alleles of the corresponding gene. Cells and animals containing recombinant expression vectors comprising the nucleic acid can be useful in study, development and treatment of migraine, FHM.

EA-2 and epilepsy. Proteins or peptides encoded by the nucleic acid and natural or synthetic antibodies against the proteins can be used to diagnose FHM, EA-2, migraine and other neurological conditions associated with cation channel disfunction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequences shown in V29330 to V29371 represent the 47 exons and flanking
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

WPI; 1999-244030/20. P-PSDB; W98156 New isolated member of the Bcl-2 family, Bim used in, e.g. cancer treatment

Claim 3; Page 96-97; 145pp; English.

The present sequence encodes the extra long form (EL) of murine Bim, or Bel-2 interacting mediator of cell death (see W88156), a novel member of the Bel-2 family that is capable of inducing cell death (apoptosis) and which acts as a 'death-ligand' for certain members of the pro-survival Bel-2 family. Bim is a BH3-only protein, as the only BH3-only protein for which splice variants exist. These only BH3-only protein for which splice variants exist. These result in the expression of a variety of isoforms, i.e. Bim-5, Bim-Land Bim-EL (see W98154-56). CDNAS encoding these murine Bim isoforms were obtained from a T lymphoma cDNA library using human isoforms were obtained from a T lymphoma cDNA library using human isoforms were obtained from a T lymphoma cDNA library using human isoforms were obtained from a T lymphoma cDNA library using human isoforms were obtained from a T lymphoma cDNA library using human chromosome 2 at bands F3-G. Human Bim-EL and Bim-EL isoforms have also been identified (see W98157-58). Binding the dynein light chain was shown to regulate the pro-apoptotic activity of Bim. Bim-S, the splice variant which does not bind to dynein light chain, is a much more potent Killer than either Bim-L or Bim-EL.

The invention provides variants (see W98159-68) of murine and human Bim-L or Bim-EL that cannot bind, couple or otherwise associate with a dynein light chain. The indentification of Bim permits the dentification and rational design of a range of products for use in therapy, diagnosis, antibody generation and involving modulation of physiological cell death. These therapeutic molecules may act as either antagonists or agonists of Bim's function and will be useful in cancer, autoimmune or degenerative disease therapy. Increased Bim expression or Bim activity is useful, e.g. for tradment or prophylaxis in conditions such as cancer and deletion of autoreactive lymphocytes in autoimmune disease. Decreased Bim expression of Bim activity is useful in regulating inhibition or prowntion of cell death or degeneration such as under cytocoxic conditions during e.g. amma-irradiation and chemotherapy or during HIV/AIDS or other viral infections, ischemia, myocardial infarction, cells being transplanted for treatment of disease. Since Bim is expressed in germ cells, modulating Bim expression or Bim activity hypoxia, degenerative diseases or for prolonging the survival of is useful, e.g. as a contraceptive or method of sterilization by of disease. preventing generation of fertile sperm.

This sequence represents an expressed sequence tag (EST), and is a polynucleotide of the invention. The polynucleotides of the invention are all secreted EST sequences isolated from a variety of human tissue sources. The EST sequences and proteins encoded by them are predicted to have useful biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, immune stimulating or suppressing activity, haematopoiesis regulating activity, tissue growth activity, and thrombolytic activity, receptor/ligand activity, the EST sequences are also stated to be useful for gene

e.g. human blood, kidney, foetal lung, placenta, testes, brain. ovary, pituitary, retina and colon cDNA libraries

The present sequence includes an exon encoding the C-terminus (see W98147) of a soluble form of a novel human cysteine-rich tumour necrosis factor receptor family member termed TRAIN.R. It comparises clone G3156, obtained from a Clontech human adult lung cDNA ilbrary. The encoded 30-amino acid C-terminal peptide is identical to amino acids 121-149 of the composite TRAIN.R protein given in W98146 and to amino acids 121-150 of the C-terminus of murine TRAIN.R short form (secreted protein, see W98144). The soluble protein is expected to inhibit signalling by the full-length TRAIN.R. Human TRAIN.R is expressed at low levels in every tissue and cell line tested thus far, with higher expression detected in heart, prostate, ovary, testis, peripheral blood lymphocytes, thyroid and adrenal gland. Cell death can be induced by administering an agent capable of inhibiting the binding of TRAIN.R to its ligand. A claimed method of treating, or reducing, the amammal comprises administering a mammal comprises administering an immunological disease in a mammal comprises administering

This sequence encodes a Streptococcus pneumoniae protein of the invention. The proteins (or their homologues, derivatives and/or fragments) are useful as immunospens or antigens. Immunospens or antigens. Compositions comprising the proteins are useful as vaccines and also in diagnostic assays. The sequences are useful for the detection or diagnostic assays. The sequences are useful for the detection or diagnostic aspable of antagonising, inhibiting or interfering with them. Agents, capable of antagonising, inhibiting or interfering with them. Agents, capable of the protein or prophylaxis of S. pneumoniae infection. As the sequences can be used to treat S. pneumoniae infection, they can be used to treat bacterial pneumonia, which has high rates in they can be used to treat bacterial pneumonia, which has high rates in they can be used to treat discretize, and in patients with predisposing conditions such as asplenia, heart, lung and kidney disease, diabetes, alcoholism, or with immunosuppressive disorders, especially AIDS. They can also be used to treat pneumococcal septicaemia, otitis media, sinusitis, and
                                                                                                                                                      Streptococcus pneumoniae infection; immunogen; antigen; diagnosis; AIDS; bacterial pneumonia; asplenia; heart disease; lung disease; alcoholism; kidney disease; diabetes; immunosuppressive disorder; otitis media; pneumococcal septicaemia; sinusitis; meningitis; therapy; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Streptococcal proteins and polynucleotides useful for diagnosis, treatment and prophylaxis of bacterial infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Le Page RWF, Wells JM, Hanniffy SB, Hansbro PM;

pharmaceutical composition which comprises a TRAIN'R blocking agent, e.g. soluble TRAIN'R. TRAIN'R can be fused to an immunoglobulin to produce a fusion protein which may be targeted to various sites. It can be used in binding assays, and to identify antagonists and agonists. Anti-TRAIN'R antibodies can be used to reduce the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a method for diagnosing a disorder characterised by expression of a human cancer associated antigen precursor coded for by a nucleic acid molecule (NAM). The method comprises: (a) contacting a biological sample isolated from a subject with an agent that specifically binds to the NAM, an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions the invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast cancer remal cancer, colon cancer, gastric cancer, prostate cancer and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Cancer associated antigen; diagnosis; research; treatment; human; breast cancer; colon cancer; gastric cancer; renal cancer; lung cancer;

The sequences given in Q67865-66 represent expression cassettes containing the vaccinia H6 promoter and the human MAGE-1 gene which encodes human melanoma-associated antigen MZ2-E, in VCP235 and pMAW037, respectively. These sequences were used in the construction of NYVAC- and ALVAC-based recombinant viruses containing the MAGE-1 gene. MAGE-1 is expressed in primary melanoma tumour cells, melanoma-derived cell innes and certian tumours of non-melanoma origins but not in normal cells except in testis. A first PCR fragment containing the last 18 bp and the initial 24 nucleotides of the MAGE-1 gene was generated and ligated to a second PCR fragment amplified from plasmid pYZ18RMAGEI which contains the initial 546 bp of the MAGE-1 coding sequence. The terminal sequence of MAGE-1 was amplified and a fusion product was generated containing the H6 promoter and the full length MAGE-1 sequence. This construct may be introduced in to the poxvirus derived plasmids,
                                                                                                                                                                                                                                                                                                Polymerase chain reaction; primer; amplify; NYVAC; ALVAC; recombinant; human; MAGE-1; melanoma-associated antigen; MZ-E; testis; pTZ18RMAGE1; primary melanoma tumour cell; melanoma derived cell line; tumour; poxvirus; antigenic response; immunological response; pathogen; ss.

                                                                                                                                                                                       patient and therefore induces an immunological response. (I) may be used to vaccinate patients against a wide range of diseases and disorders be used to vaccinate patients against a wide range of diseases and disorders be used to vaccinate against diseases such as rabies, influenza and Newcastle Disease. It is particularly useful for immunising against cancers. The poxxirus (I) also provides a means of manipulating lymphocytes and tumour cells for use in cell-based immunotherapeutic modalities for cancer. (I) also have enhanced safety compared to unattenuated viruses (attenuation reduces the virulence of the viruses) and known recombinant poxvirus vaccines. This increased level of safety reduces the possibility of a 'tunaway' infection in the host and reduces the chance of transmission from vaccinated to unvaccinated individuals
                                                                                                                                                                                                                                                                                                                                                                                                         and contamination of the environment. The present sequence represents a H6/MAGE-1 expression cassette and flanking regions from pMAW037
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Polymerase chain reaction; primer; amplify; NYVAC; ALVAC; recombinant; human; MAGE-1; melanoma-associated antigen; MZ2-E; testis; pTZ18RWAGE1; primary melanoma tumour cell; melanoma-derived cell line; tumour; poxvirus; antigenic response; immunological response; pathogen; ss.
                                                                                                                                         The present invention describes a recombinant poxvirus (I), comprising exogenous DNA encoding an antigenic determinant of a pathogen which is then expressed in vivo in infected host cells after administration to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                               Recombinant poxviruses comprising exogenous DNA encoding antigenic determinants useful in immunotherapy to immunize against cancers and other diseases such as influenza, Newcastle Disease and rabies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ő

                                                                                                                                                                                              containing the vaccinia He promoter and the human MAGE-1 gene which encodes human melanoma-associated antigen M22-E, in vCP235 and pMAW037, respectively. These sequences were used in the construction of NYVAC- and ALVAC-based recombinant viruses containing the MAGE-1 gene. MAGE-1 is expressed in primary melanoma tumour cells, melanoma-derived cell lines and certian tumours of non-melanoma origins but not in normal cells except in testis. A first profit ragment containing the last 18 bp and the initial 24 nucleotides of the MAGE-1 gene was generated and the initial 24 nucleotides of the MAGE-1 gene was generated and inject to a second PCA fragment amplified from plasmid pT218RAAGE1 which contains the initial 546 bp of the MAGE-1 coding sequence. The terminal sequence of MAGE-1 was amplified and a fusion product was generated containing the He promoter and the full length MAGE-1 sequence. This construct may be introduced in to the poxylius derived plasmids, ALVAC and NYVAC. The resulting viruses may be used in a composition for inducting an antigenic or immunological response, ie. for immunisation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                        unattenuated viruses (attenuation reduces the virulence of the viruses) and known recombinant poxvirus vaccines. This increased level of safety reduces the possibility of a 'runaway' infection in the host and reduce
                                                                                   The present invention describes a recombinant poxvirus (I), comprising exogenous DNA encoding an antigenic determinant of a pathogen which is then expressed in vivo in infected host cells after administration to a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             individuals
                                                                                                                                                                                                                                                                 тау
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                reduces the possibility of a 'runaway' infection in the host and reduc
the chance of transmission from vaccinated to unvaccinated individuals
and contamination of the environment. The present sequence represents
                                                                                                                                                                                     patient and therefore induces an immunological response. (I) may be u to vaccinate patients against a wide range of diseases and disorders depending on the type of antigen encoded by the exogenous DNA. (I) may be used to vaccinate against diseases such as rables, influenza and Newcastle Disease. It is particularly useful for immunising against cancers. The poxvirus (I) also provides a means of manipulating modalities for cancer. (I) also have enhanced safety compared to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0; Gaps

New isolated human genes and the secreted polypeptides they encode useful for diagnosis and treatment of e.g. cancers, neurological disorders, immune diseases, inflammation or blood disorders

Claim 1; Page 271; 464pp; English.

This sequence represents a nucleic acid molecule which encodes a secreted human protein. The gene number, and the clone it is derived from, are detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin Fc portion (e.g. X27302) for increasing the stability of the fused protein as

compared to the human protein only.

The invention relates to 123 novel genes and their fragments (nucleic acid sequences: X27311-X27449; amino acid sequences Y02650-Y02788) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polypucleotides. Specific uses are described for each of the 123 polypucleotides, based on which tissues they are most highly expressed in (see X27311 for described
                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence represents the 3' region of hepatitis C virus RNA. The original sample was obtained from human and chimpanzee plasma. RNA was isolated from several samples and homology compared, and the respective sequence of about 1900 - 2500 nucleotides of the 5' terminus and 1100 nucleotides of the 3' terminus determined.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                           The present sequence encodes a mammalian forkhead activin signal transducer (FAST) protein, designated FAST2. The protein is a winged-helix/forkhead domain protein. The protein is an inducer of the homeobox gene goosecoid (GSC) by transforming growth factor (TGF)-beta or activin signaling. FAST2 binds to a nucleotide sequence in the gsc promoter. The FAST2 protein is useful for modulating signal transduction in a TGF-beta or activin signaling pathway, which involves FAST2 as transcription factor, by modulating the formation of Smad2/Smad4/FAST2 complex. Inhibition of FAST2
                                                                                                                                                                                                                                                                                                                                    binding to its target DNA site inhibits FAST2 specific TGF-beta signaling, which is associated with wound healing inflammation, and tumour progression. Excessive signaling is associated with scarring, arthritis and fibrosis in numerous diseases, including fibrosis of the liver and kidney.
                                                                                                                       New mammalian transcription factor, useful for preventing or treating disorders associated with transforming growth factor beta or activin signaling pathways ^{\rm -}

                                                                                                                                                                                                                    of the C-terminal portion of the Streptococcus pneumoniae LYTA protein (CLTAA), the human MAGE-1 tumour-associated antigen and a hexalistidine tail. A vector designed for recombinant expression of the fusion protein in Escherichia coli is provided. The CLYTA moiety provides expression of soluble fusion protein, facilitates affinity purification of the fusion protein, and also acts as a affinity purification of the fusion protein, and also acts as a nimunological fusion partner, e.g. Clyta-MAGE-1-His. These novel fusion proteins provide vaccines for immunotherapy of melanomas or other MAGE-associated tumours like breast, bladder, lung and consmall cell lung cancer, head and squamous cell carcinoma, colon carcinoma and oesophagus carcinoma.
                                                                  New protein derivatives used in cancer vaccine therapy for treating a range of cancers including melanomas, carcinomas and cancers of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New protein derivatives used in cancer vaccine therapy for treating a range of cancers including melanomas, carcinomas and cancers of

partner such as Deposition of the LPD moiety provides the fusion partner such as LPD. The LPD moiety provides the fusion protein with additional exogenous T-cell epitopes and also increase expression levels in E. coli. The lipid tail ensures optimal presentation of the antigen to antigen-presenting cells. The affinity tag facilitates purification. The novel fusion proteins provide vaccines for immunotherapy of melanomas or other mAAGE-associated tumours like breast, bladder, lung and non-small cell lung cancer, head and squamous cell carcinoma, colon carcinoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequence is shown folded into secondary structure in the specification. It was compared with other sequences available in the literature to design probes specific for SRB. The probes can be used for the rapid identification and quantification of SRB in a sample, e.g. oil-field prodn. waters, water from water treatment facilities, or samples from the gut of ruminant animals.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           on homology with Streptociccus mineral proteins) are GTP-binding proteins ERA homolog, and represents a DNA sequence of the invention. The DNA sequences were isolated from Streptococcus pneumoniae strain 0100993 (NCIMB 40794). The Streptococcus pneumoniae proteins of the invention can be used to identify compounds which interact with and inhibit or activate the activity of the proteins. Antagonists can be used to treat diseases caused by S. pneumoniae proteins, through genetic immunisation. They can also be used to induce an immunological response in amammal by inoculation with the S. pneumoniae proteins or delivery of the encoding nucleic acids in a vector adequate to produce antibody and/or I cell immune responses to protect the animal from disease. The proteins can also be used to identify antimicrobial compounds which are capable of inhibiting their bioactivity. In particular the proteins of the invention can be used to prevent adhesion of bacteria to mammalian extraorallular matrix proteins on in-dwelling devices or in wounds, to block protein-mediated mammalian cell invasion, and to block the normal progression of pathogenesis in infections initiated other than by the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequence is that of a Streptococcal polypeptide coding region. The polypeptide can potentially be used for the diagnosis and prevention of bacterial infections, especially SP infection. It may be used for the treatment of diseases such as otitis media,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Lonetto MA, Nicholas RO;

Methods have been developed for identifying a compound, which binds to a human or murine D6 protein, an allelic variant or a fragment comprises detecting binding of the test compound to the protein. Also described in the present invention are: (1) a method for identifying a compound capable of treating a disorder characterised by aberrant D6 nucleic acid expression of D6 protein activity; (2) a method for treating a subject having a disorder characterized by aberrant D6 nucleic acid expression comprising administering to the subject a D6 modulator such that treatment of the subject occurs; and (3) methods for identifying a compound that modulates the activity of a Human or murine D6 protein, an allelic variant or a fragment. The methods are useful for identifying compounds capable of treating disorders, especially a respiratory inflammatory disorder, characterized by aberrant D6 nucleic acid expression or D6 protein activity. In particular, the disorder is asthma. D6 modulators are used to treat asthma. The present sequence encodes the murine D6 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Transforming growth factor-beta superfamily signailing; modulator; Smad2; TGF-beta; detection; FAST-1; MH2 domain; Smad interaction domain; SID; treatment; developmental; disorder; immunological; cancer; diagnosis; ss.

                                          polypeptide; HHPDZ65; stroke; pain; epilepsy; therapy; disease; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           polypeptide of the invention. HHPDZ65 is useful for the treatment of stroke, pain, epilepsy, neurodegenerative diseases and others. The DNAs and proteins are useful in a method for screening to identify compounds which stimulate or inhibit the function of the HHPDZ65 proteins. The polypeptides are useful in a process for diagnosing a disease or a susceptibility to a disease in a subject related to expression or activity of the HHPDZ65 polypeptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

ţ
Modulating TGF-beta superfamily signalling - comprises use of compounds identified in assays with Smad2, FAST-1 and Smad3, used develop products for treating, e.g. developmental disorders
```

Example XII; Page 70; 107pp; English

a method to detect a compound capable of modulating transforming growth factor-beta (TGT-beta) superfamily signalling. The invention describes accomplex which forms between FAST-1 and Smad2 and this complex is specifically induced by signals generated by a TGF-beta superfamily member. A domain of FAST-1 directly interacts with Smad2 and this molecules, namely, the MH2 domains of the two interacting molecules, namely, the MH2 domain of Smad2 and the Smad interacting for the detection and treatment of conditions involving abnormal TGF-beta superfamily signalling. They can be used to treat e.g. developmental disorders, immunological disorders and cancer. The products can also be This sequence encodes a mouse FAST-1 protein which is used in used for detection and diagnosis.

The sequences are also useful in producing pharmaceutical compositions for treatment of pancreatic tumors. Z52858-Z53014 represent expressed sequence tag (EST) fragments derived from a human pancreatic tumor cDNA library and which encode the proteins represented in Y73814-Y74252.
precursor (TRAP) MAGE-Al cDNA, which encodes a 309-amino acid precursor (TRAP) MAGE-Al cDNA, which encodes a 309-amino acid polypeptide (see W8154B). MAGE-Al cDNA shows homology to novel human MAGE-CI cDNA (see V65720), especially in exons 2 and 3.

The open reading frame of MACE-CI, however, is about 2 kb longer than that of MAGE-Al, most of the difference being accounted for by a large repetitive sequence. MAGE-CI (see W81546) is a novel member of the MAGE family that may be recognised by cytotoxic rells, leading to lysis of the tumour cells which express it. It is expressed in a variety of tumours and in normal testis cells, but not by other normal cells. The invention provides MACE-CI and MACE-CI and control of the difference of cytolytic I cells specific method for determining the presence of cytolytic I cells specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ä

The present sequence encodes human cell division regulator (HCDR) 1. HCDR proteins are active in interphase, and are used for the treatment or prevention of inflammation and disorders associated with cell proliferation and apoptosis. HCDR may be administered to a patient having a disorder associated with an increase in apoptosis,
                                                                                                                                                                                                                                                                Human cell division regulator; HCDR; interphase; inflammation; cell prolliferation; apoptosis; neurodeficiency; neurodegenerative disease; aplastic anaemia; isohaemic injury; liver damage; viral infection; hepatitis B; hepatitis C; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This cDNA encodes a human beta(1 -> 4)·N·acetylglucosaminyl-transferase (GnT-IV)b enzyme. The invention provides bovine and human GnT-IV enzymes that can be used for converting sugar chain subunits having one structure to another structure. Vectors containing the DNA sequences encoding these enzymes can be used to transform host cells for the production of the GnT-IV enzymes. The enzymes are useful in the production of branched oligosaccharides and polysaccharides which are difficult of access by other methods. They are also useful in the production of drugs, reagents and foods and in modifying the properties of biopolymers containing sugar chains. The enzyme may also be used for the preparation of glycoproteins
                                                                                                                                                                                                                                                                                                                                                                             Beta(1 -> 4)-N-acetylglucosaminyl-transferase; GnT-IV; bovine; human;

The present sequence is the coding sequence of human TRAF four associated factor TRAF2. The gene was discovered by screening a human placenta cDNA library using a two-hybrid system. The protein associates with the TRAF domain located at the carboxyl-terminal of TNF seceptor associated factor 4 (TRAF4), which is believed to be an oncoprotein. Antiboddes that bind to TNF four associated factors (TRAFs) may be used to treat or diagnose tumours (e.g. breast cancer) when labelled with an isotope or an appropriate drug, precursor or enzyme. Antagonists, agonists, and antisense sequences of TRAFs may be used to treat cancers. TRAF proteins, antibodies that recognise them and DNAs

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence encodes the human cell division regulator-1 (HCDR-1) protein of the invention. Polynucleotides complementary to the HCDR-1 coding sequence can be used as probes to detect the DNA in a sample. The polynucleotide sequences encoding HCDR may be used to prevent/treat inflammation and disorders associated with cell proliferation and apoptosis and in assays that detect activation of cancers. Polynucleotides encoding HCDR may be used for the diagnosis of conditions associated with expression of HCDR, including disorders associated with cell proliferation/apoptosis e.g. adenocarcinoma and AIDS. The polynucleotides may also be used in Southern or Northern analysis, dot blot, or other membrane based technologies; in PCR technologies; or in dipstick, pin, or ELISA assays or microarrays utilising fluids or tissues from patient biopsies to detect altered HCDR expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           TFAF2; TRAF four associated factor 2; tumour formation; breast cancer; TRAF4; TNF receptor associated factor; tumour diagnosis; ds.

The present cDNA sequence encodes human epidermal protein-6 (HEPI). The cDNA clone is derived from PTHYNOT03 library which was constructed using fema isolated from left parathyroid tissue of a 69-year-old caucasian female during a partial parathyroidectomy. Recombinant, vectors comprising HEPI cDNA are introduced into host cells for protein expression. The HEPI proteins are useful for the treatment of epithelial disorders, including dyshidroic cozema and scabies, cell proliferative disorders including actinic keratosis and arteriosclerosis, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Tumour rejection antigen; vaccine; cancer; E antigen precursor gene; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                     The gene encodes a nitrite reductase gene isolated from Populus nigra. The gene is useful in generation of street trees with a high power for clarfiying NO2, an atmospheric pollutant. The gene can also be used in transgenic plants, esp. crops, bred to contain less nitrosamines (a carcinogenic substance present in food).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   dyshidrotic eczema; cell proliferative disorder; actinic keratosis; arteriosclerosis; autochumune disorder; inflammatory disorder; acquired immune deficiency syndrome; AIDS; Addison's disease; antiHIV; dermatological; anitarterlosclerotic; antiinflammatory;

072476 encodes tumour rejection antigen E, another sequence concodes melanoma antigen-3 (MAGE-3) a tumour rejection antigen precursor. Melanomas characterised by the expression of MAGE-3 can be detected, or monitored, by contacting a test sample with an agent that can recognise MAGE-3. The melanoma can be treated by the administration of cytolytic T cells specific for the complex of antigen D (the mature rejection antigen derived from MAGE-3) and a human
new family of genes refered to as melanoma antigens (MAGE) (see also Q32352-69).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Tumour rejection antigen E; melanoma antigen-3; MAGE-3; cancer; cytolytic T cells; antigen D; human leucocyte antigen; ss.

This antigen is expressed along with antigens "D, F and A" by the human melanoma cell line MZ2-MEL. These antigens are all recognised by cytolytic T cells. A subline of MZ2-MEL is MEL3.1 which only expresses antigen E. This cell line was chosen as a source for the isolation of this sequence. This sequence was found to contain three exons. The open reading frame for antigen E was contained within the first two exons. An ATG is caded at position 66 of exon 3 and is followed by an 828 base pair reading frame. The three exons contain 65, 73 and 1551 base pairs. During the isolation of this sequence two different but closely reated copna were also identified. These cobnas, when tested, did not transfer expression of antigen E, but they did show substantial homology to the antigen E cDNA sequence. These new cDNAs represent a
                                                                                       This sequence represents the E antigen precursor gene. The invention relates to a tumour rejection antigen sequence that is useful as a tumour rejection antigen for vaccination against cancerous
                                                                                                                                                                                                                                                                                                           Gaps

072472 is the tumour rejection antigen E precursor gene, another gene Q72470 encodes melanoma antigen-3 (MAGE-3) also a tumour rejection antigen precursor. Melanomas characterised by the expression of MAGE-3 can be detected, or monitored, by contacting a test sample with an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Tumour antigen rejection precursor E; melanoma antigen-3; MAGE-3; cancer; cytolytic T cells; antigen D; human leucocyte antigen; ss.
                                                                                                                                                                                                                                                                                     This sequence represents the antigen E coding sequence. The invention relates to a tumour rejection antigen sequence useful as a tumour rejection antigen for vaccination against

These peptides are useful for defining epitopes that engender a HLA-restricted cytotoxic lymphocyte activity against MAGE-1 antigens. Compans. containing these peptides can be administered, as a vaccine to patients susceptable to MAGE

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Ruben SM,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Feng P,
Kyaw H,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         22-AUG-1
```

```
This sequence represents a nucleic acid molecule designated Gene 85 from the human cDNA clone HSDFY29 (deposited as clone ATCC 209076) which encodes a secreted human protein. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin Fc portion (e.g. V59502) for increasing the stability of the fused protein as compared to the human protein only.

The invention relates to 186 novel genes and their fragments (nucleic acid sequences: V59511-V59812; amino acid sequences W74731-W75025) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the presence of mutations in the new polyneclecities. Specific uses are described for reach of the 186 polynucleotides, based on which tissues they are most highly expressed in (see V5911 for described
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes novel human nucleic acid (cDNA) sequences (A), that are highly expressed in uterine tumour tissue and which have anticancer and cytostatic activity. (A) are used (i) for recombinant expression of polypeptides (B) and (ii) to isolate complete genes. (B) are used (i) to identify agents suitable for treatment of uterine or endometrial cancer; (ii) directly for treating these forms of cancer (including expression from gene therapy vectors) and (iii) for generation of specific antibodies. (A) are identified by assembling BSTs (expressed sequence tags) from a particular tissue type before comparison of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ы

```
expression patterns. This allows a significantly longer fragment of the gene to be revealed, so should reduce the number of failures associated with the fact that ESTs from different libraries may represent different parts of the same unknown gene, distorting the estimated frequency of occurrence in a particular tissue. Z41981-Z42121 represent EST fragments derived from a human endometrium tumour cDNA library which encode the protein sequences represented in Y59941-Y60328.

HHPD265 polypeptide(s), their corresponding DNA, antibodies, agonists and antagonists - are useful in the treatment of stroke, pain, epilepsy and neurodegenerative diseases

Claim 7; Page 14; 31pp; English.

invention. HHPDZ65 is useful for the treatment of stroke, pain, epilepsy, neurodegenerative diseases and others. The DNAs and proteins are useful in a method for screening to identify compounds which stimulate or inhibit the function of the HHPDZ65 proteins. The polypeptides are useful in a process for diagnosing a disease or a susceptibility to a disease in a subject related to expression or activity of the HHPDZ65 polypeptides. This sequence encodes the HHPDZ65 neurodegenerative polypeptide of the

Recombinant DNA contg a consensus sequence common to genes that are repressible by oxygen and inducible by formate under anaerobic conditions and the fdhF promoter used as a simple expression system for foreign genes. Expression does not require temp shifts or addition of inducers. (Formate is produced naturally by microorganisms in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New recombinant DNA contg consensus sequence and specific promoter providing foreign gene repression under anaerobic conditions
                                                                                                                                                                       repression/expression of foreign genes by oxygen/formate;

This polynucleotide comprises clone pA1276 that codes for human T-cell surface antigen CD97 (see W48756). It was isolated from a T-cell library enriched for mitogen-induced genes. The invention relates to the previously unrecognised alpha subunit of CD97 that acts in the establishment and maintenance of inflammation. Soluble CD97 acts as an adhesion factor for endothelial cells and smooth muscle cells, implicating it as a modulator of atherosclerosis. CD97 alpha also acts as a motility factor to cells bearing the alpha(v)beta-3 receptor, indicative of a role in angiogenesis. Soluble CD97 alphal, alpha2, and alpha3 subunits (having different combinations of EGF repeats) all originate as a proprotein with the beta subunit (see W48756). Host cells transfected with a nucleic acide encoding a CD97 alpha subunits are claimed. CD97 alpha subunit polypeptides, nucleic acids, antibodies and antagonists (e.g. CD97 subunit antisense nucleic acids) are used in claimed complementations for indiamed to methods for: determining the degree of inflammation and are site:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  atheroslerosis; and treating or inhibiting

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Overlapping clones which make up this sequence were isolated from a mouse Peripheral Blood Lymphocyte lambda gt10 cDNA library. The protein encoded by this sequence is purified and can mediate the cytolytic activity of mammalian cells. It specifically distinguishes tumour cells making it a candidate for the development of products for the immunodetection and immunotherapy of tumours.

Overexpression of nitrate reductase (NR) can stimulate the early development of plants, shortening the duration of the vegetative phase and causing earlier germination, flowering and ripening by about two weeks. Overexpression of NR can also cause the level of nitrate stored in a plant to be reduced, reducing risks to health and also possibly improving organoleptic qualities. The NR gene was tunnfroduced into plants by transforming a strain of Agrobacterium tunnefaciens with a plasmid and using it to infect the subject
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Xenopus protein; chordin; dorsal tissue; neural tissue; vertebrate; endodermal differentiation; treatment; neurodegenerative disease; nerve cell; transforming growth factor; TGF; secreted protein; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention provides purified and isolated human 7-transmembrane receptor lectomedin polypeptide or its fragments. The lectomedin polypeptide or its fragments. The lectomedin like and mucin-like domains. The polypeptide can be produced by standard recombinant methodology. The polypeptide is involved in cellular adhesion and cytoplasmic metabolic pathways that are modulated by extracellular signaling. Specific binding to lectomedin-lexpressed on smooth muscle cells may be required for proliferation of these cells in atherosclerosis. The polypeptide is used to raise specific antibodies, and to identify specific binding agents that modulate (increase or decrease) its activity. The lectomedin nucleic acids are used as source of probes and primers, and of therapputic antisense, ribozyme or triplexforming agents and in gene therapy to restore deficient lectomedin activity. Specific binding agents of lectomedin are are used for treating diseases that involve lectomedin activity, e.g. vascular diseases such as atherosclerosis. The present sequence represents the DNA encoding the human CD97 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

                                                                                                                                                                                                                                                                                                                                                                                 Since the promoter region of the nifH operon has been isolated, characterised and cloned, it is possible to delete the nifH and nifHD nitrogenase genes and replace them with structural genes isolated from an extraneous source. The extraneous genes thus placed under the control of the nifH promoter can then be inserted into a plasmid vector followed by conjugation into a fast-growing R.
                                                                                                                                                                                                                                                                                           promoter of fast-growing Rhizobium japonicum - used to drive

                                                                                                                                                                                                                                                                                                        This cDNA encodes a Xenopus protein "chordin". The functional recombinant protein chordin has a defined sequence of 941 amino acids and can induce dorsal and neural development and endodermal differentiation in vertebrates. The presence of a hydrophobic signal sequence, four possible N-glycosylation sites and conserved Cys-rich repeat regions suggest that chordin is a secreted protein. The DNA sequence can be operatively linked with an expression vector, to form a construct and a transformant can be obtained by introducing the construct into a host. Chordin may be useful as a component of culture media for culturing cells such as nerve or muscle cells, for treating neurodegenerative diseases and damaged nerve
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                  DNA encoding Xenopus frog protein - that induces dorsal and neural development and endodermal differentiation in vertebrates
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence of nitrogen fixation gene H (nifH) promoter and coding region and the nifH-nifD intergenic region.

The present expanded cDNA sequence encodes human BAG-5 (Bcl-2 associated athanogene-5) protein. BAG is a Hsc70/Hsp70-regulating protein (Brs70/Hsp70) is a molecular chaperone that participates in controlling protein bloactivity, degradation, complex assembly/disassembly and translocation across membranes). It competes with Hip for binding to the Hsc70/Hsp70 ATPase binding domain and promotes substrate release. Gene transfection studies indicate that BAG proteins influence a wide variety of cellular phenotypes through their interactions with Hsc70/Hsp70, including increasing resistance to apoptosis, promoting cell proliferation, enhancing tumour cell migration and metestasis and altering transcriptional activity of steroid hormones. BAG also stimulates Hsc70-mediated adenosine triphosphate (ATP) hydrolysis by
proliferation, cell migration and metastasis and steroid hormone

                                                                                                        New isolated receptor tyrosine kinase, CCK-4 - used for developing prods. for the diagnosis and treatment of CCK-4 signal transduction disorders, partic. colon cancer
                                                                                                                                                                                                                     A cDNA sequence (745351) codes for a novel human receptor tyrosine kinase, colon carcinoma kinase-4 (W08747), or CCK-4, which is preferentially expressed in cancerous colon tissue, compared with normal colon. The cDNA sequence is a consensus of 6 overlapping cDNA clones isolated from a human placenta library using primers based on conserved motifs of protein tyrosine kinase catalytic domains. CCK-4 nucleic acids can be used in the prodn. of recombinant CCK-4 polypetides, and as probes in the diagnosis and screening of CCK-4 signal transduction disorders, esp. colon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;

This cDNA clone includes a coding region for human Fanconi anaemia complementation group C (FAC, see W66546), a protein that modulates approcise in haematopoletic progenitor cells (HPC). The invention provides conjugates, including fusion proteins, comprising FAC and a targetting molecule which binds to a cell surface protein of the HPC and is internalised. Such targetting molecules include interleukin-3 (see W68547) and antibodies which recognise CD33 (see W68546-49). The conjugate, or a nucleic acid encoding it, can be used to deliver FAC to an HPC, specifically to inhibit apoptosis, particularly in patients exposed to high doses of chemotherapy for treatment of non-myeloid cancers, also to treat Fanconi anaemia (by complementation of the genetic defect). Treatment of HPC is done in vitro, ex vivo (e.g. for recombinant production of conjugate in cell cultures) or in vivo. Treatment with FAC may eliminate the need for extensive bone marrow transplants to restore
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               melanoma antigen; MAGE TRA; melanoma antigen tumor rejection antigen;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequences given in Q51426-28 represent cDNA varients from the Fanconi Anemia Group C Complementing (FACC) cDNA. These three cDNA molecules are cellular varients of a single cDNA transcribed from the same gene. The three cDNAs each contain an identical open reading frame encoding the FACC protein. The FACC protein may be used for the diagnosis and study of Fanconi anemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                             The sequences given in 032352-69 represent a new family of genes refered to as melanoma antigens (MAGE). The cDNAs of this gene family were identified during the isolation of the antigen E gene. The MAGE CDNAs, when tested, did not transfer expression of antigen E, but they did show substantial homology to the antigen E cDNA sequence. The MAGE DNAs share a certain degree of homology with each other and are expressed in tumnour cells including several types of human tumor cells as well as in human tumors. MAGE expression is not restricted to melanomas. MAGE refers to a family of tumor rejection antigen precursors. The antigens resulting from these genes are referred to as MAGE TRAS or melanoma antigen tumor rejection antigens. See also Q32351.

Another melanoma antigen MAGE-3 is encoded by Q72470, this is a tumour rejection antigen precursor. Melanomas characterised by the expression of MAGE-3 can be detected, or monitored, by contacting a test sample with an agent that can recognise MAGE-3. The melanoma can be treated by the administration of cytolytic T cells specific for the complex of antigen D (the
